

Fireside Rotary Temple mounted on AVL Loom

Below are 2 pictures showing different installations of our Rotary Temple on AVL looms. When deciding how to place your mounting brackets for the track, align the bracket so the measurement from the top of the bracket to the top of your roller beam is 3". When the Rotary Temple is slid onto the track, the top of the rotary temple will be parallel with the top of your roller beam allowing your weaving to move evenly through the temple. Any deviation from the 3" measurement affects the angle at which your weaving enters the temple and slight variations should not affect your weaving.

For this mounting position, our standard "T-handle" 5/32" allen wrench will not fit below the bracket to secure the track. We can provide a "L-shaped" allen wrench.
